#1   We want to manage a list of students

Id
FirstName
nameName

Get the list of student from the file : students.json

getStudents()   # return the list of students

Get the list of student from the file : students.json

#2   Manage the request to get the list of students

GET /students   # return the list of students

You need to test this request on THUNDER client

#3   Display the list of student on the view

1- Request the list of students using AXIOS

2- Update the DOM to display all students

Student : 1
- First name : RONAN
- Last name : SUPERMAN

Student : 2
- First name : HIM
- Last name : SUPERWOMAN

#4   Manage the request to ADD a student

POST /student

Body = { firstName = xxx, lastName = YYY }

You need to manage the ID on the server

You need to test this request on THUNDER client

#5   Update the view with a form to add a student
